Securing Australian Export Growth Through Intelligent Regulation

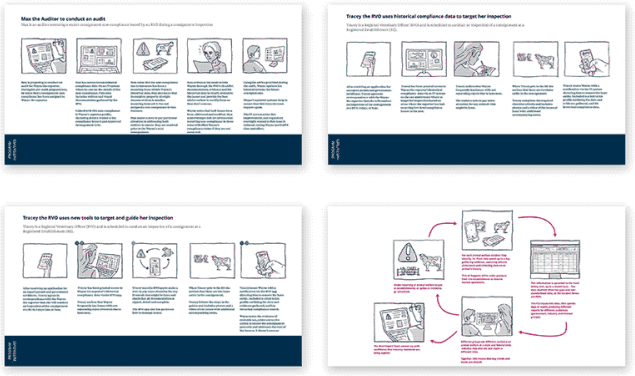

Department of Agriculture, Fisheries and Forestry
Interaction Designer | Sep 2021 - Jun 2025

How do you make complex agricultural export regulations easier for government staff to manage? I spent four years working with the Department of Agriculture, Fisheries and Forestry as an Interaction Designer, helping turn paper-based compliance processes into practical digital staff tools.

Challenge

Department staff relied on a mix of paper forms, legacy systems and manual processes to capture compliance information. I needed to help the team understand how people actually worked before we could design something better.

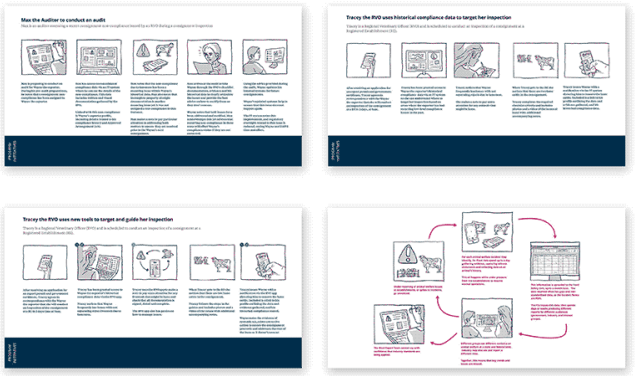

Approach
I started by mapping service blueprints and user journeys with the team, helping us understand existing workflows and where digital tools could make a difference.

From there, I led interaction design activities across a compliance capture tool and a compliance data dashboard. I sketched concepts, created low-fidelity wireframes and interactive prototypes, and worked directly with department staff in discovery workshops and concept testing.

I translated the feedback into high-fidelity UI designs, handed them over to developers and stayed involved throughout implementation and ongoing maintenance. This included reworking paper forms into connected digital workflows, from user registration through to compliance data capture.

As the work expanded into additional commodities and regulatory areas, I helped adapt and extend the designs. I also helped shape the department's design system through component and pattern development, testing and sharing usability findings with the wider design community. The work of the Agriculture Design System team was later recognised with a 2026 Good Design Award for Digital Interface ↗.

Outcome
Our work helped modernise compliance processes, giving staff better tools for capturing and using regulatory data. Following a successful proof of concept, the approach was extended into additional areas.

One particularly encouraging result was that usage of the Veterinary Consignment Inspections tool increased to nearly 100% after workflow improvements informed by user feedback, a task that previously had high falloff rates and low data quality. Understanding how people work in the real world, then making the digital experience fit that reality is where good interaction design starts.

The project was awarded a 2023 Good Design Award for Public Sector Services ↗.

Simplifying the Cross-Border Trade Experience for Businesses to Strengthen the Australian Economy
Simplified Trade System Implementation Taskforce (Austrade)
Experience Designer | Sep 2021 - Mar 2022

Importing and exporting goods can involve a surprising number of steps, systems and government agencies. I joined Tobias's work with the Simplified Trade System Taskforce to help make that complexity visible and understand how the experience could be improved for Australian businesses.

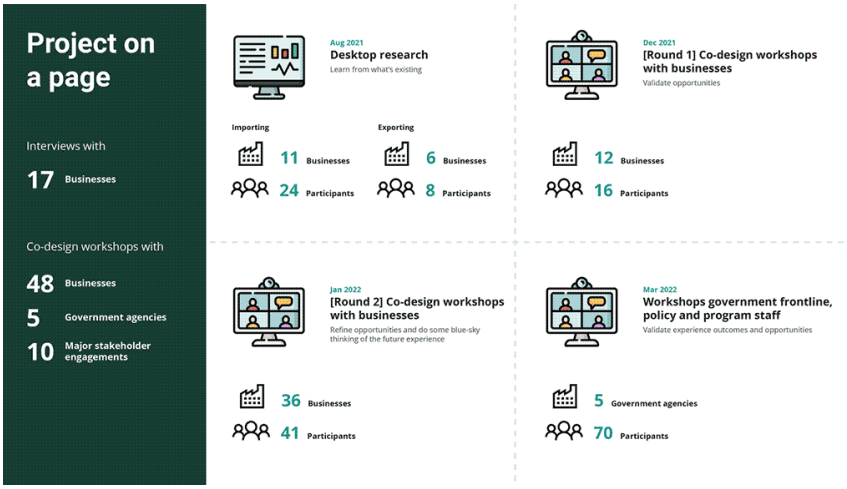

Challenge
The taskforce needed a clearer picture of the end-to-end trade journey, not just individual government services. Without that shared view, it was difficult for agencies to see where businesses were getting caught up or where changes could have the greatest impact.

Approach
I helped turn research and stakeholder input into visual artefacts that people could actually use to understand the problem.

Working alongside the research and design team, I assisted with user research, co-design workshops, stakeholder engagement and collaboration across government agencies. I also mapped user flows and produced service blueprint materials to connect the different steps, touchpoints and behind-the-scenes processes involved in trading across borders.

A big part of my contribution was visualising the current-state journey in a way that made sense to people outside the immediate research team. This resulted in importing and exporting journey maps that were almost ten metres long when printed, bringing together a complex web of interactions in one place.

These journey maps helped stakeholders see the experience from a business's perspective, discuss pain points together and identify opportunities that crossed agency boundaries.

Outcome

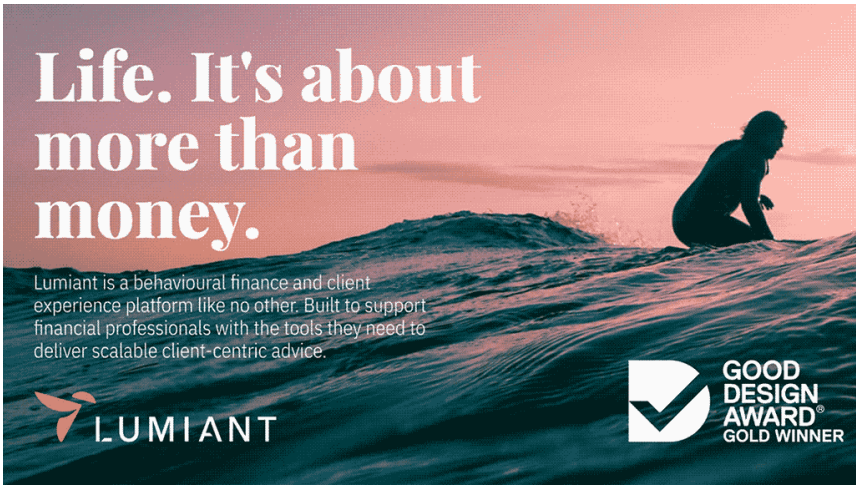

The research engaged 159 participants across 65 Australian businesses and five government agencies. The journey maps helped establish a shared understanding of the current trade experience and highlighted opportunities for coordinated reform. One of the most useful things designers can do is make a complicated problem tangible. When people can see the whole experience in front of them, it's much easier to have conversations about what can and needs to change.

The project was awarded a 2022 Good Design Award for Design Research ↗.

Design, Build & Launch a Brand New Fintech Venture Within a Year
Lumiant
Experience Designer | 2019 - 2021

How do you build an entirely new fintech venture in less than a year? Our team designed Lumiant, a financial advice platform built around a simple idea: financial planning should start with what matters to people, not just their money.

Challenge
Traditional financial advice can feel technical and transactional. Lumiant wanted to help advisers have more meaningful conversations with clients and connect financial strategies to their personal values and life goals.

The challenge was turning that idea into a distinctive brand, a usable digital product and a cohesive experience within a tight launch timeframe.

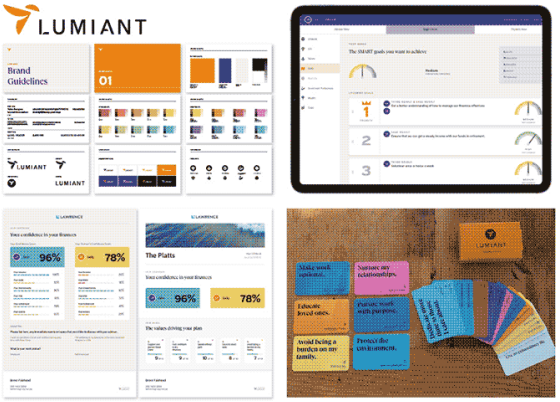

Approach
As part of the Tobias team, I worked across product, brand and communications design, helping translate the venture's concept into tangible experiences. I designed finance and reporting

concepts, exploring how financial information could be presented clearly and connected to clients' broader goals.

Beyond the digital product, I contributed to Lumiant's brand identity, including logo design and brand guidelines. I worked on marketing and advertising collateral to keep the visual language consistent across different touchpoints, and created promotional video production and motion design deliverables.

Working across these disciplines meant thinking about the experience as a whole. The product, brand and marketing all needed to tell the same story: a different kind of financial advice, centred on people and the lives they wanted to lead.

Outcome
Lumiant launched within nine months, bringing together a values-centred advice proposition, digital tools and a cohesive brand experience. Product design is more than interface. Together product, brand and story make a new idea easier to understand, trust and ultimately adopt.

The project was awarded a [2021 Gold Good Design Award for Commercial Services ↗]().

A Human-Centred Approach to Owning the US$5 Billion Tattoo Removal Market
Removery
Experience Designer | 2019 - 2021

Tattoo removal is a personal decision and the experience involves much more than a clinical or medical procedure. I worked on Removery's transformation into a leading tattoo removal service, helping turn research and strategy into a consistent brand and customer experience.

Challenge
Removery brought together three businesses with 34 clinics across the United States. Each had its own brand, processes and approach to customer care.

The challenge was to create a recognisable, consistent experience that could scale as the business grew, without losing sight of the different reasons people seek tattoo removal.

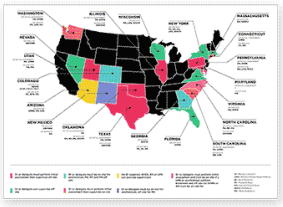

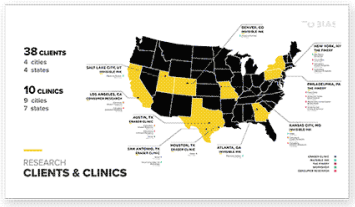

Approach
As part of the Tobias team, I worked across brand development, customer experience and visual storytelling to help bring the strategy to life.

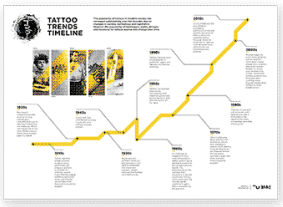

I helped guide the brand foundations, identity and guidelines, creating visual assets to support a consistent experience across the business. I also developed customer experience artefacts, including journey maps and a CX playbook, to help communicate the story of the user research as it was being conducted by our team and played back to the business venture executives.

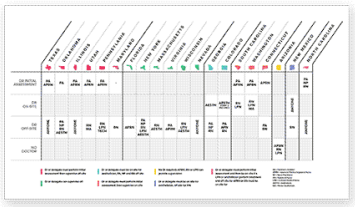

Workshop design and facilitation were another part of my contribution. I helped prepare visual materials for workshops and playbacks, giving stakeholders a way to explore research findings, discuss ideas and align around the direction.

I also worked on educational video production and motion design, helping communicate information in a more engaging and accessible way. This extended the experience beyond the clinic itself and supported a more consistent approach to customer education.

Outcome
The work helped establish a clearer brand and customer experience framework to support Removery's growth. Research only becomes useful when people can act on it. Taking complex insights and turning them into visual systems, practical tools and stories help teams deliver a better experience.

The project was awarded a 2020 Good Design Award for Design Strategy ↗ and a 2021 Good Design Award for Design Research ↗.
